UPDATING CODE WITH VALIDATION

Abstract of the Disclosure

In one embodiment, the present invention includes a method to initiate updating of a second portion of a system if a value indicates that the system is in a trusted state.

5 In such an embodiment, a first portion of the system may validate updated code before the second portion of the system is updated. In one such embodiment, the first portion may be an applications portion and the second portion may be a communications portion of a wireless

10 device.
